技术规格

Background:	The globular WW domain, named for the conserved tryptop han residues in the protein motif present in various structur al and regulatory proteins, is known to play a role in the m ediation of protein-protein interactions. This gene encodes a ligand of the WW domain of the Yes kinase-associated prot ein. Readthrough transcription of the neighboring upstream gene, which encodes INO80 complex subunit B, into this ge ne generates a non-coding transcript.
